

Unilever plc — Argentina & Türkiye Hyperinflation Model

Hyperinflation Accounting Analysis — CFA LII Multinational Operations

Group Operating Profit (IFRS actual)	EUR 8,496.2m
Net Monetary Gain/(Loss)	EUR -195.0m
Earnings-Quality Signal	Flag: immaterial
Materiality Ratio	2.3%
As-of Year	2024

Investment Thesis

Unilever plc is a global consumer-goods group that reports under IFRS. Two of its operating subsidiaries sit in economies classified as hyperinflationary: Argentina (functional currency ARS, hyperinflationary since 1 July 2018) and Türkiye (TRY, since 1 July 2022). For both, Unilever first restates the local accounts under IAS 29 into current purchasing power, then translates them into euros at the closing rate under IAS 21. The group discloses the aggregate effect of this treatment every year but does not publish the underlying subsidiary statements. The model's 2024 consolidated figures are total assets of €46,545m, revenue of €60,845m and operating profit of €8,496m. These are illustrative: the rest of the group is modelled at an illustrative scale, not Unilever's reported ex-Argentina/Türkiye figures. The IAS 29 net monetary line is a loss of €195m. Argentina accounts for all of it and more (a €206m loss), and Türkiye partly offsets it with an €11m gain.

The model's earnings-quality read is **"Flag: immaterial"**. The net monetary loss equals about **2.3% of group operating profit**, well under the model's 10% materiality threshold. Because the denominator is illustrative, the ratio is indicative only. At group level, then, the hyperinflation effect on the purchasing-power line does not move the needle on the model's own measure. The Recommendation section tests whether that conclusion holds up.

The tension this report examines is between two levels of the business. In the subsidiary accounts the effect is dramatic: Argentina earns a "C" monetary-exposure grade, with a net monetary loss of roughly 18% of its €1,125m of total assets. For a €46.5bn group, though, the result is a rounding-sized item. Whether that gap makes it a genuine group-level concern or a teaching-grade curiosity is left to the Bulls Say / Bears Say section.

On market perception, consensus (TipRanks: Moderate Buy across 10 analysts, average target 5,080p against a 4,664.50p close on 25 September 2026) shows no sign of treating the IAS 29 net monetary gain/(loss) separately from ordinary FX translation. Public 2026 earnings-call transcripts and aggregator commentary cover Argentina and Türkiye only as volume and pricing stories inside a generic "currency headwind". That finding rests on public sources only, because paywalled broker notes were not accessible.

Bulls Say

- **At group level the purchasing-power hit is a rounding item.** The 2024 IAS 29 net monetary loss of €195m equals about 2.3% of group operating profit (€8,496m), well under the model's 10% materiality threshold. Colgate-Palmolive, which reports under US GAAP, reached the same "not material" conclusion for its own Argentina, Türkiye and Nigeria exposure through a completely different accounting regime.
- **Headline profitability barely depends on the accounting choice.** Across the model's three worlds, 2024 operating profit ranges only from €8,490m (World A, no restatement) to €8,496m (World C, IAS 29 plus IAS 21), and ROA ranges from 18.45% to 18.25%. Restatement adds €417m to revenue, but €255m of that is absorbed by higher COGS. Restated equity is also higher (€20,785m against €20,246m), so debt-to-equity is lower under IFRS (1.24x against 1.27x). Nothing in the core ratios hinges on how hyperinflation is booked.
- **The exposure sits in one subsidiary, not two.** Türkiye earns an "A" monetary-exposure grade. Its 2024 net monetary line was actually a gain of €11m, an exposure ratio of +2.6% of its €420m of total assets. Argentina, graded "C", has €1,125m of total assets, which is about 2.4% of the €46.5bn group.
- **The operations underneath the accounting are performing, and the market leans positive.** Management described Argentina as delivering high single-digit volume growth in Q2 2026. TipRanks consensus is Moderate Buy (5 Buy / 3 Hold / 2 Sell), with an average target of 5,080p against the 4,664.50p close, about 8.9% implied upside.

Bears Say

- **Argentina's loss runs against the textbook, which makes it hard to forecast or hedge.** The model grades Argentina "C": its €206m net monetary loss is about 18% of the subsidiary's €1,125m of total assets. The calibrated subsidiary is in a net monetary *liability* position, which the standard heuristic says should produce a gain, yet it books a loss because restated equity and profit grow faster. The illustrative subsidiaries also hold no protective assets. By contrast, BBVA offset part of its Türkiye loss with a €1,202m inflation-linked-bond gain in 2023.
- **The 2024 tailwind reversed in 2025.** Unilever's disclosed 2025 operating-profit impact was –€54m for Argentina and –€46m for Türkiye, against +€10m and –€4m in 2024, and the turnover impact turned negative (–€90m and –€16m). The model's out-of-sample 2025 roll-forward gets the sign right on only 3 of 4 lines for each subsidiary. It misses the total-assets sign entirely (+€183.7m modelled against –€199m disclosed for Argentina) and badly understates the operating-profit hit (–€1.4m against –€54m). The effect is harder to predict than the 2024 calibration suggests.
- **The 2.3% comfort ratio stands on an illustrative denominator.** The rest of the group in the model is an illustrative scale, not Unilever's actual reported ex-Argentina/Türkiye figures, so the materiality ratio is indicative only. The wider currency picture is not small either: management said currency reduced H1 2026 turnover by 4.9% and underlying EPS growth by about 6 percentage points.
- **The market isn't looking at this line.** Public 2026 earnings-call transcripts and aggregator commentary never separate the IAS 29 net monetary gain/(loss) from generic "currency headwind". Paywalled broker notes could not be checked. Analysts' targets already range widely (3,900p to 6,000p, with 2 Sells), so a monetary-line surprise that nobody is tracking could land with little warning.
- **There is no clear exit.** Türkiye's headline inflation has eased toward ~31%, yet it remains classified as hyperinflationary on IAS 29's qualitative indicators (per EY's April 2026 list). The IFRS Interpretations Committee's July 2025 agenda decision reaffirmed that all of those indicators must be weighed, not just the headline rate. Unilever has carried Argentina under IAS 29 since July 2018 and Türkiye since July 2022. Peer Reckitt Benckiser cut its own exposure by divesting Argentina on 31 December 2025.

Economic Moat

Moat Rating: None (Argentina) / None (Türkiye) (local positions only; the global brand franchise is a separate, wider question)

Unilever's global brands and sourcing scale are not in question. At group level, the hyperinflation drag is small: the 2024 net monetary loss of €195m equals about 2.3% of €8,496m of operating profit. Inside the two hyperinflationary markets, the case for a durable local advantage is weaker, and it differs by subsidiary.

Pricing power. In 2024, restatement added €230m (Argentina) and €187m (Türkiye) to turnover but only €10m and –€4m to operating profit. That gap is largely mechanical: the model restates revenue and costs by the same flow factor, so the restatement mostly cancels at the profit line and is not itself evidence of margin cushion or pricing power. In 2025, when FX-regime changes plausibly reversed the inflation-versus-depreciation relationship (a reversal the model's 2025 assumptions encode as a modeling choice), the disclosed operating-profit impacts (–€54m and –€46m) were out of proportion to the turnover impacts (–€90m and –€16m). On the Q2 2026 call, a Jefferies analyst noted that pricing was flat in the region despite hyperinflation and called it "some sort of price reset". That remark covered the region, not Argentina specifically, and it did not say whether prices were lagging inflation.

Monetary exposure (illustrative). Argentina is graded **C**. Its €206m net monetary loss equals 18.3% of its €1,125m of total assets (exposure ratio –0.183). The cause is not trapped cash: the subsidiary is in a net monetary *liability* position, yet it still loses real value once restated equity and profit are rolled forward. Türkiye is graded **A**, with an €11m gain and an exposure ratio of +0.026 on €420m of assets. The overall grade is **C**.

The monetary-asset/liability split behind these grades is a modeling choice, not a Unilever disclosure, so the grades describe the model's illustrative balance sheets rather than how management actually runs them.

Experience. Argentina has been hyperinflationary since July 2018; Türkiye only since July 2022. The newer market nonetheless shows the smaller monetary exposure in the model, though that split is a modeling choice rather than a disclosure, so it cannot show whether longer experience has turned into a local advantage in Argentina.

Verdict. Argentina: **None** locally. Volumes are holding up (high-single-digit growth in Q2 2026), but regional pricing was flat in Q2 2026 despite hyperinflation, which gives no evidence of local pricing power. Türkiye: **None** locally. This is a judgment, not something the data show: Unilever's disclosures cover only the IAS 29 restatement effects, not the subsidiary's underlying profitability, and the model's 2024 pre-IAS 29 operating result for Türkiye comes from the calibration, not from a disclosure. Neither is big enough to dent the group moat. The subsidiary-level figures are illustrative, calibrated to reproduce Unilever's disclosed aggregates.

Valuation, Sensitivity & Scenarios

The model runs Unilever's Argentina and Türkiye subsidiaries through three accounting worlds. **World A** is the plain current-rate method: local-currency figures are translated at current FX with no inflation restatement. This is the "disappearing plant" baseline, where historical-cost fixed assets shrink in euro terms as the peso and lira depreciate. **World B** is the US GAAP temporal method, which remeasures non-monetary items at historical FX and monetary items at current FX and produces a *remeasurement* gain or loss. **World C** is the IFRS treatment Unilever actually reports: IAS 29 restatement to the closing price index, followed by IAS 21 translation at the closing rate. All three are accounting treatments of the same underlying economics. They are not three different valuations of the business.

For 2024, revenue is €60,428m in both World A and World B and €60,845m in World C. Operating profit is €8,490m in A and B and €8,496m in C. Total assets rise from €46,006m (A) to €46,108m (B) and €46,545m (C). The monetary line is zero in World A, a €271.8m remeasurement loss in World B, and a €195.0m net monetary loss in World C. The divergence has a clear shape. World C adds about €417m to revenue and €539m to total assets compared with World A, but only about €6m to operating profit. Restating both revenue and costs by the same inflation factor largely cancels out at the profit line, even though the gross revenue and asset figures move much more. The World C net monetary loss is about 2.3% of group operating profit, which is below the model's 10% materiality threshold, so the mechanical signal is "Flag: immaterial".

By subsidiary, IAS 29 added €474.0m to Argentina's total assets, €230.0m to its turnover and €10.0m to its operating profit, and produced a €206.0m net monetary loss. Türkiye's restatement added €65.0m to total assets and €187.0m to turnover, reduced operating profit by €4.0m, and produced an €11.0m net monetary gain. Argentina's loss runs against the textbook heuristic. Its solved net monetary position is a *liability*, which would normally suggest a purchasing-power gain. However, the monetary plug also nets against the inflation-driven growth of restated opening equity and operating profit. That fast-growing restated base turns an apparent "liability means gain" setup into a net loss. The heuristic is useful for orientation, but it breaks down once every line of a consolidated balance sheet is restated.

The 2025 figures were not re-fitted. They roll the 2024 model forward, and the model then matches the disclosed sign on three of four lines for each subsidiary:

- **Turnover:** Argentina –€31.3m against –€90m disclosed; Türkiye –€47.4m against –€16m.
- **Operating profit:** Argentina –€1.4m against –€54m; Türkiye –€3.3m against –€46m.
- **Net monetary result:** Argentina –€23.8m against –€46m; Türkiye –€113.3m against –€10m.

Magnitudes are off in places. The model undershoots both operating-profit lines and overshoots Türkiye's net monetary line. Total assets do not match in sign: the model shows +€183.7m against –€199m disclosed for Argentina and +€46.1m against –€20m for Türkiye. This is structural. Restating non-monetary assets for a rising price index can only increase them, and Worlds A and C divide by the same closing FX rate. The model therefore cannot produce a negative asset impact. Unilever's disclosed negative figure probably reflects disposals, impairments or a comparative-basis convention that the model does not capture. This remains an open limitation, not a clean match.

Peers disclose the same effect in different ways:

- **Coca-Cola FEMSA (Argentina) and BBVA (Türkiye, via Garanti BBVA)** also report IAS 29 effects. Coca-Cola FEMSA books a net monetary *gain* (Ps.154m in H1 2025) on its Argentine liabilities, the textbook result that Unilever's Argentina does not show. BBVA's 2023 Türkiye net monetary loss of €2,118m was partly offset by a €1,202m gain on inflation-linked bonds, a hedge that this model does not represent.
- **Colgate-Palmolive** reports under US GAAP and describes its highly-inflationary designations as immaterial, disclosing no dollar figure. Under a different accounting regime, it independently reaches the same qualitative conclusion this model reaches for Unilever.
- **Reckitt Benckiser** is an IFRS filer. It reports only a bundled "exchange and hyperinflation" revenue item (£394m in 2025, up from £24m in 2024), which shows that not every IFRS filer discloses at Unilever's level of detail.

Financial Health

Overall Grade: C

The grade comes from a simple, documented rule: each subsidiary's net monetary gain/(loss) is divided by its restated (IAS 29) total assets, and the absolute value of that ratio is mapped to a letter grade (Argentina C, Türkiye A). The overall grade of C matches the weaker of the two. It measures one thing, how exposed each balance sheet is to purchasing-power erosion. It is not a broader credit or solvency score.

| Subsidiary | Sub-grade | Net monetary gain/(loss) | Total assets | Exposure ratio |

|---|---|---|---|---|

| Argentina | **C** | €(206.0)m | €1,124.9m | –18.3% |

| Türkiye | **A** | €11.0m | €419.8m | +2.6% |

Argentina alone sets the overall grade. Its net monetary loss of €206.0m equals roughly 18% of its total assets. The loss is not the textbook result of holding excess cash and receivables: Argentina sits in a net monetary *liability* position, and the loss arises because the monetary plug nets against the inflation-driven growth of restated opening equity and operating profit. Because the subsidiary's monetary-asset/liability split is a modeling choice rather than a Unilever disclosure, this says nothing about how management actually runs Argentina's balance sheet. It is the subsidiary whose working-capital and funding mix investors should watch. Türkiye's small €11.0m gain against €419.8m of assets means its net monetary position barely moves under inflation.

These figures are for **2024**, the primary calibrated year. That is the year whose local-currency inputs were solved to reproduce Unilever's disclosed IAS 29 figures. The 2025 roll-forward is only a directional check, not a snapshot of the current position. The subsidiary balance sheets are also an illustrative reconstruction, not Unilever's own disclosure.

Market Consensus Comparison

The Street's view is mildly positive. TipRanks shows 10 analysts rating the stock a Moderate Buy (5 Buy, 3 Hold, 2 Sell), with an average 12-month target of 5,080p against a close of 4,664.50p on 25 September 2026. Coverage of the hyperinflationary subsidiaries is thin. On the Q2 2026 call, the only analyst reference came from David Hayes of Jefferies, who said that "pricing was obviously flat in the quarter despite the hyperinflation... some sort of price reset going on there." Management talked about Argentina only in terms of volume, noting that it "delivered high single-digit volume growth." Across the Q1 and Q2 2026 transcripts and the aggregator commentary we reviewed, Argentina and Türkiye come up as volume and pricing stories plus a generic currency headwind. **None of this public commentary separates the IAS 29 net monetary gain/(loss) from ordinary FX translation.** The Q2 2026 call does not mention the monetary line at all.

Measured against the size of the effect in our model, that silence is mostly proportionate. The 2024 group net monetary loss is €-195.0m, about 2.3% of operating profit (€8,496.2m) and well below the 10% materiality threshold. The group total does hide an offset, though. Argentina contributes €-206.0m and carries a C exposure grade, with a net monetary exposure equal to about -18% of its total assets. Türkiye adds a small gain of €+11.0m and grades A. Treating everything as "FX headwind" hides the fact that Argentina accounts for all of the net loss.

One caveat: paywalled broker notes (Jefferies, JP Morgan, UBS, Bernstein and others) were not accessible, so this conclusion rests only on public transcripts and aggregators.

Recommendation

Recommendation: Hold. The hyperinflation effect gives no edge at group level.

This call is narrow. It is not an intrinsic-value target price, because this model does not build a DCF or multiples valuation. It answers one question only: does the market misprice Unilever's IAS 29 hyperinflation effect?

Step 1: the materiality flag decides the call. In 2024 the group's net monetary loss was €195.0m, against group operating profit of €8,496.2m. That is about 2.3% of operating profit, well below the 10% materiality threshold, so the mechanical signal is **"Flag: immaterial"**. Under the decision rule, that settles it. However the market treats this line, it is too small to support a directional call either way.

Step 2: the consensus finding is real but doesn't matter here. Our consensus research found that public consensus does *not* separate the net monetary gain/(loss) from ordinary FX. Analysts on the Q1 and Q2 2026 calls treat Argentina and Türkiye as volume and pricing stories plus a generic "currency headwind". The one analyst mention of hyperinflation on the Q2 call was about pricing, not the monetary line. So the market may well be blind to this effect. But being blind to a ~2% item is not a tradeable mispricing. The Hold here is the "immaterial" kind. It is not the "already priced in" kind. One caveat: paywalled broker notes weren't accessible, so the consensus conclusion rests on public transcripts and aggregators only.

Where the risk sits. In 2024, the net monetary exposure sat entirely in **Argentina**. Its €206.0m net monetary loss in 2024 was more than the whole group loss of €195.0m. It had an exposure grade of C and an exposure ratio of -18.3%. Türkiye made a small gain of €11.0m (grade A). Unilever's 2025 disclosures show net monetary losses in both markets: Argentina -€46m and Türkiye -€10m (Türkiye having swung from its 2024 gain). On the net monetary line the drag is smaller than in 2024 (-€56m against -€195m). The wider picture got worse, though: the disclosed hyperinflation impact on operating profit swung from +€6m in 2024 to -€100m in 2025, and on turnover from +€417m to -€106m.

What would change the call. The call would change if the net monetary loss rose toward 10% of operating profit while commentary kept folding it into generic FX. That would move us to **Sell-leaning / Caution** on earnings quality. Until then, this effect supports no directional view on the stock. For context only, and not as an endorsement, TipRanks shows a Moderate Buy from 10 analysts, with an average target of 5,080p against a 4,664.50p close.

Risks & Uncertainty

Argentina is the weak link (grade C). Its 2024 net monetary loss of €-206.0m equals about 18.3% of the subsidiary's €1,124.9m total assets. That €-206.0m loss on its own exceeds the whole group's €-195.0m loss; Türkiye (grade A, +2.6%) offsets only €11.0m. A further inflation or FX shock hits this line directly. The loss arises even though Argentina sits in a net monetary liability position, so the simple "liability → gain" heuristic cannot be relied on to cap the downside.

Model limitation. This is a calibrated illustrative model, not a reproduction of Unilever's actual subsidiary accounts. It matches the 2024 calibration almost exactly, but the out-of-sample 2025 pass matched sign on only 3 of 4 lines per subsidiary, and magnitudes were off. Operating profit came out at €-1.4m against a disclosed €-54m for Argentina, and the net monetary line at €-113.3m against €-10m for Türkiye. The total-assets line cannot turn negative under this model's mechanics: it produced +€183.7m against a disclosed €-199m for Argentina, and +€46.1m against a disclosed €-20m for Türkiye. Treat any *forward* projection from it with corresponding caution.

Macro regime shifts. 2024's positive impacts came from local inflation outpacing managed FX depreciation. Argentina's April 2025 peso float and Türkiye's continued lira depreciation plausibly reversed that relationship (the model's 2025 assumptions encode this reversal as a modeling choice, not a disclosed fact), and the sign of most lines can swing year to year.

Market pricing. Public consensus (TipRanks: 5,080p target vs a 4,664.50p close, Moderate Buy) contains no evidence of separating the IAS 29 net monetary line from generic "currency headwind." Paywalled broker notes were not checked. At 2.3% of operating profit (below the 10% materiality threshold), the effect is too small for that blind spot to be a tradeable mispricing.

Classification. Hyperinflation status rests on judgment across IAS 29.3's qualitative indicators, not a single bright-line inflation number. The IFRS Interpretations Committee confirmed this in July 2025. Türkiye's inflation is easing toward ~31%, so a future reclassification out of hyperinflationary status is a live possibility that would change the restatement effect in scope. Conversely, a newly hyperinflationary subsidiary would bring a new effect into scope.

Materiality basis. The 2.3%-of-operating-profit ratio behind the "immaterial" flag (10% threshold) is measured against an illustrative group base, not Unilever's reported figures.
